

REPORT

DEPARTMENT OF RADIOLOGY

EXAM: Bilateral knees, multiple views (AP standing, PA flexion weight-bearing, oblique and lateral views) **DATE OF SERVICE:** 2026-xx-xx **PATIENT:** De-identified — Female — DOB 1941-xx-xx (Age 84) **INDICATION:** Knee pain. **COMPARISON:** None available.

FINDINGS:

Right knee: Postsurgical changes are present, with a plate and multiple screws fixating the proximal tibia. The hardware appears intact without definite evidence of fracture or loosening. There is deformity of the proximal tibia. Degenerative changes are noted with joint space narrowing, osteophyte formation, and subchondral sclerosis. No acute fracture or dislocation. No joint effusion identified. Soft tissues are unremarkable.

Left knee: No fracture or dislocation. Mild to moderate degenerative changes with joint space narrowing and marginal osteophytes. No significant joint effusion. No radiopaque foreign body. Soft tissues are unremarkable.

IMPRESSION:

- Postsurgical changes of the right knee with plate-and-screw fixation of the proximal tibia, intact. Associated osseous deformity.
- Degenerative changes of the right knee.
- Mild to moderate degenerative changes of the left knee.
- No acute fracture or dislocation.

Electronically signed.
